Entrepreneurship Awareness visit to Dairy Plant was organised by the Department of Public Health Dentistry at Harbans Milk Dairy Plant in Mohiuddinpur, Uttar Pradesh on 4th November 2023. The programme was meticulously executed by Dr. Nidhi Agarwal (Principal, IDST and Professor and Head, Pediatric and Preventive Dentistry) and Dr. Shilpi Singh (Professor & Head, Public Health Dentistry)

Description: Dental Students (Final Year and Interns) from the Department of Public Health Dentistry of Institute of Dental Studies & Technologies, Modinagar visited to Harbans Milk Dairy Plant in Mohiuddinpur, Uttar Pradesh on 4th November 2023. The students were accompanied by one faculty member – Dr. Sumit Tewari.

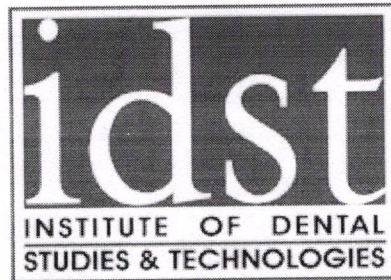

Mr S P Tomar was the guide for industrial visit in Dairy Plant. He also demonstrated about the milk processing stages.

1. Cleanisation,
2. Homogenisation,
3. Standardization
4. Pasturization

After successful processing, milk is dispatched in a hygienic and sterilized milk tanker and is then transported under cold chain to various distribution formats (milk shops, franchises, shops, kiosks, insulated containers, container on wheels). Students were informed about various tests to check the purity of milk and were shown the processing plant of the Dairy. The students also learned about how milk is collected from the corporate farmers, strictly undergoes with more than 27

tests of quality control i.e. adulterants, temperature, taste, fragrance & weight. They also gave the information about various varieties of milk i.e. token, toned, full cream & skimmed milk, based on its fat and SNF (Solid not fat). They showed storage tanks, homogeniser, pasteuriser and other machines of the Mother Dairy Plant. Finally on the completion of tour, the appetite was duly taken care with refreshments.

S.No.	Units	UO (or) UP	Principle Applications
1.	Micro strainer	UO	Remove algae and plankton from the raw water
2.	Aeration	UP	Strips and oxidizes taste and odour causing volatile organics and gases and oxidizes iron and manganese. Aeration systems include gravity aerator, spray aerator, diffuser and mechanical aerator.
3.	Mixing	UO	Provides uniform and rapid distribution of chemicals and gases into the water.
4.	Pre-oxidation	UP	Application of oxidizing agents such as ozone, potassium permanganate, and chlorine compounds in raw water and in other treatment units; retards microbiological growth and oxidizes taste, odor and colour causing compounds
5.	Coagulation	UP	Coagulation is the addition and rapid mixing of coagulant resulting in destabilization of the colloidal particle and formation of pin-head floc

DEPARTMENT OF PUBLIC HEALTH DENTISTRY

Name of the event: SEWAGE TREATMENT PLANT

Under the able guidance of Dr. Vikram Gandhi (Secretary, DMET), an **Awareness visit to Sewage Treatment Plant** was organised by the Department of Public Health Dentistry at 56,M.L.D sewage treatment plant, Dhundhera, Ghaziabad, Uttar Pradesh on 3rd April 2024. The programme was meticulously executed by Dr. Nidhi Agarwal (Principal, IDST and Professor and Head, Pediatric and Preventive Dentistry) and Dr. Shilpi Singh (Professor & Head, Public Health Dentistry)

Description: Dental Students (Interns) from various departments of Institute of Dental Studies & Technologies, Modinagar visited to 56, M.L.D sewage treatment plant, Dhundhera, Ghaziabad, Uttar Pradesh on 3rd April 2024. The students were accompanied by one faculty member – Dr. Sumit Tewari.

PURPOSE OF THE PROJECT

The main purpose of the project is to identify:

- Current wastewater disposal and treatment techniques,
- Ongoing sanitation initiatives and projects,
- Stakeholders in the sanitation sector,
- The administration structures related to sanitation projects,
- A possible project implementation agency,
- Sites for future pilot projects.

The total management of wastewater can be separated into four categories:

- Waste water collection,
- Waste water treatment,
- Treated wastewater disposal
- Sludge management
- Waste only becomes non-hazardous to human health after treatment.

WHAT IS WASTEWATER TREATMENT?

“The term treatment means separation of solids and stabilisation of pollutants. In turn stabilisation means the degradation of organic matter until the point at which chemical or biological reactions stop.

Treatment can also mean the removal of toxic or otherwise dangerous substances (for e.g. heavy metals or phosphorous) which are likely to distort sustainable biological cycles, even after stabilisation of the organic matter.”(Sasse, 1998) General Parameters to measure organic pollution.

COD (Chemical Oxygen Demand) is said to be the most general parameter to measure organic pollution. COD describes how much oxygen is required to oxidise all organic and inorganic matter found in the wastewater sample. BOD (Biological Oxygen Demand) describes what can be oxidised biologically, with the help of bacteria and is always a fraction of COD.

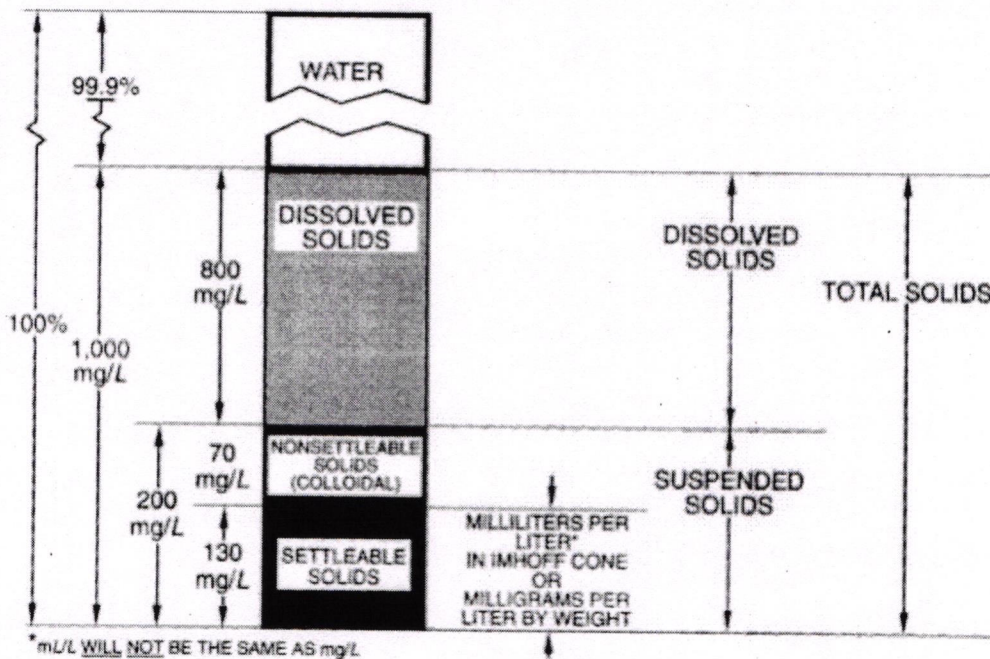

Usually BOD is measured as BOD5 meaning that it describes the amount of oxygen consumed over a five-day measurement period. It is a direct measurement of the amount of oxygen

Institute of Dental Studies & Technologies

Principal

consumed by organisms removing the organic matter in the waste. SS (Suspended Solids) describes how much of the organic or inorganic matter is not dissolved in water and contains settleable solids that sink to the bottom in a short time and non-settleable suspended solids.

It is an important parameter because SS causes turbidity in the water causing clogging of filters etc. The mentioned parameters are measured in 'mg/l'.

LEVELS OF WASTEWATER TREATMENT

Wastewater treatment options may be classified into groups of processes according to the function they perform and their complexity:

PRELIMINARY TREATMENT – includes simple processes that deal with debris and solid material. The purpose of preliminary treatment is to remove those easily separable components. This is usually performed by screening (usually by bar screens) and grit removal. Their removal is important in order to increase the effectiveness of the later treatment processes and prevent damages to the pipes, pumps and fittings.

Institute of Dental Studies & Technologies

Principal

PRIMARY TREATMENT – is mainly the removal of solids by settlement. Simple settlement of the solid material in sewage can reduce the polluting load by significant amounts. It can reduce BOD by up to 40%. Some examples of primary treatment is septic tanks, septic tanks with upflow filters, Imhoff tanks.

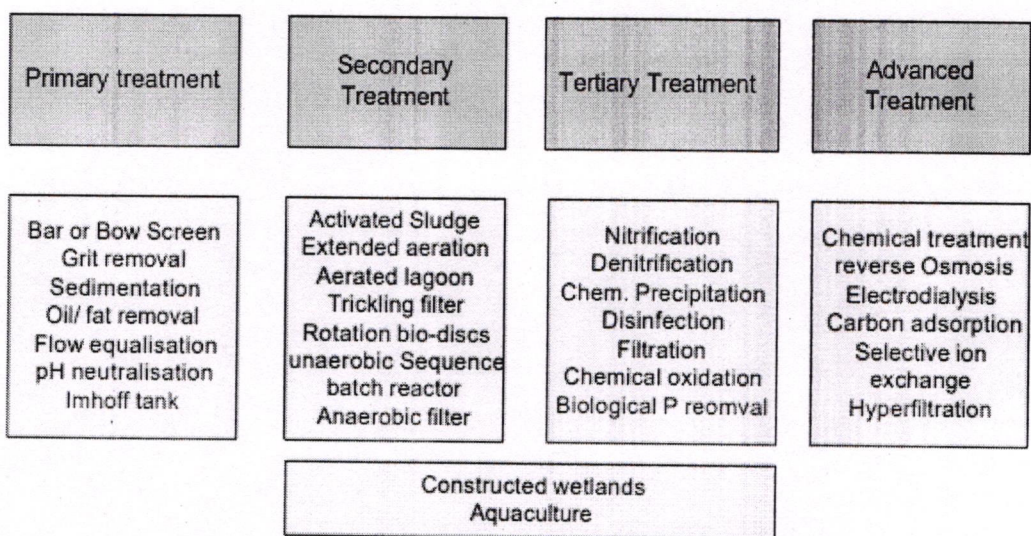

SECONDARY TREATMENT – In secondary treatment the organic material that remains in the wastewater is reduced biologically. Secondary treatment actually involves harnessing and accelerating the natural process of waste disposal whereby bacteria convert organic matter to stable forms. Both aerobic and anaerobic processes are employed in secondary treatment. Some examples of secondary treatment are UASB, reed bed systems, trickling filters and stabilisation ponds.

TERTIARY TREATMENT – is the polishing process whereby treated effluent is further purified to acceptable levels for discharge. It is usually for the removal of specific pollutants e.g. nitrogen or phosphorus or specific industrial pollutants.

Tertiary treatment processes are generally specialised processes. Some examples of tertiary treatment are bank's clarifiers, grass plots, etc.

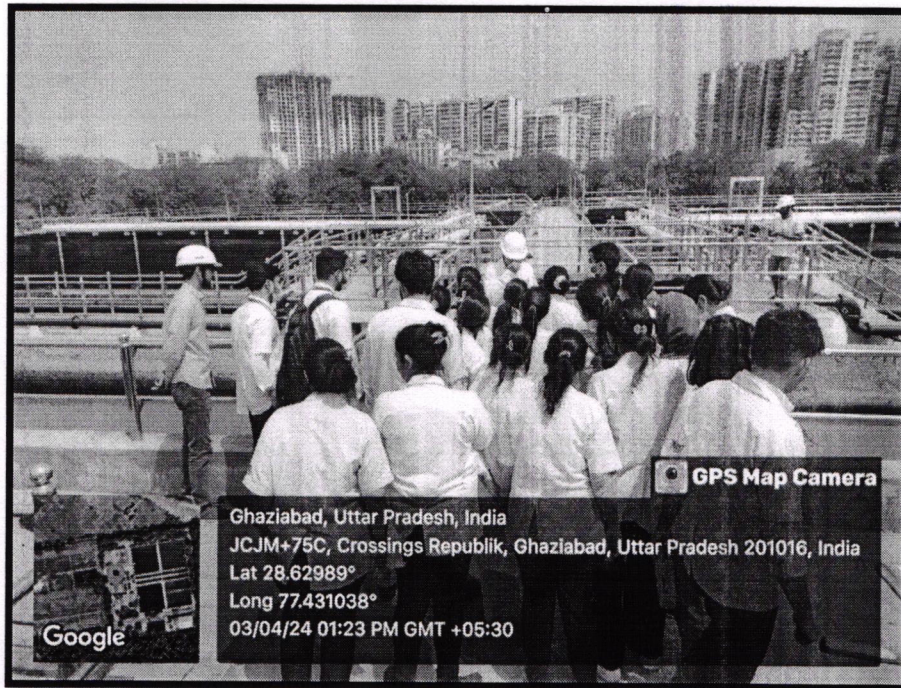

The majority of secondary treatment processes are biological in their nature – i.e. they use the natural activity of the bacteria to break down polluting material. biological treatment processes can themselves be divided into two general sub-divisions – aerobic and anaerobic processes.

ADVANCED OR QUARTIAIRY TREATMENT are applicable only to industrial wastes to remove specific contaminants.
